QR-04c: Failed deployment should automatically roll back to the last live revision

These screenshots are from an actual failed `deploy-prod` run of the CD pipeline, not a scripted demo. The deployment ran normally through build-and-push, a pre-migration database backup (captured and uploaded as an artifact as a deeper safety net), the production migration, and the deployment and health-checking of the new ("green") backend, frontend and CLIP revisions. During traffic cut-over, **"Shift traffic to green (backend)" succeeded, but "Shift traffic to green (frontend)" failed** with `ContainerAppOperationInProgress` — Azure declined to modify `ca-frontend-prod` because another provisioning operation on that app was still in progress — and the step exited with code 1.

Because a step failed, the pipeline's `if: failure()` handlers ran automatically. **"Rollback to previous revisions (failure event)" (40 s)** shifted 100% of traffic on *both* apps back to the revisions that were live before the deploy (recorded earlier in "Capture current live revisions") and deactivated the half-deployed green revisions — so even the backend, which had already cut over, was reverted rather than left in an inconsistent state. **"Rollback migrations" (10 s)** then ran `dotnet ef database update` back to the migration recorded before the deploy. The smoke test and the post-success clean-up steps were skipped. Production was left on the **last known-good application revisions and database schema with no manual intervention** — exactly the health-gated, automatic-rollback behaviour the reliability requirement specifies.
